使用演算法:Constrained (considering vertical constraints) left-hand algorithm 步驟:

- 1. 讀取完所有的 pin 之後,將 vertical constraint 存入 vcg 矩陣內。
- 2. 根據 pin-label 對所有的 pin 進行 sort。
- 3. 根據 greedy 法則,每回合選取 unconstrained pin 進行 route 直到 routing 結束。

程式執行方式: ./main.exe <input_file> 程式輸出:

```
Sorted intervals of nets:
  I2[1, 3]
 I1[1, 4]
I3[2, 4]
Vertical constraint:
  I1->I2
  I2->I1
 I3->I1
track_1:
 head(s): I3,
  route I3[2, 4]: watermark = 4;
track 2:
 head(s):
track_3:
 head(s):
track 4:
  head(s):
track_5:
 head(s):
(4) detailed information about each net
The resulting routing graph:
col: 1 2 3 4
pin: 2 0 1 3
(1) Number of tracks: 5
(2) Overall wire length: 8
   Number of vias: 7
```
